Why Sit-Stand Desks are making a *move*?

There are many reasons why Facility Manager's now have their eyes turned towards sit-stand desks as means to a more ergonomic workplace.

General Workstation Design Principles

- Make the workstation adjustable, enabling both small and large persons to fit comfortably and reach materials easily.
- Avoid static loads, fixed work postures and job requirements in which operators must frequently, or for long periods: lean to front or side; hold a limb in a bent or extended position; tilt the head forward more than fifteen degrees; support the body's weight with one leg.
- Set the work surface above elbow height for tasks involving fine visual details and below elbow height for tasks requiring downward forces and heavy physical effort.
- Allow workers, at their discretion, to alternate between sitting and standing.
- Provide floor mats or padded surfaces for prolonged sitting.
- Design the primary work area so that arm movements or extensions more than 15" are minimized.
- Provide dials and displays that are simply, logical, easy to read, reach and operate.

The advantages of a Sit-Stand desk:

- Adjustable from 600mm - 1200mm
- Increased productivity
- Reduced costs
- Reduced absenteeism & employee turnover
- Improves employee retention, health & satisfaction
- Adaptability: Multi-shift and Job rotation (Hot-Desking)
- A perfect fit for all employees
- Quick and effortless adjustment
- Choice between sitting and standing
- Added flexibility

Algorithm for office workstation: comfort + micro breaks = productivity

Statistics tell the story:

- \$1 out of every \$3 spent on workers compensation goes for muscular skeletal disorders (MSD's) - related claims.
- The most common health problems that employees suffer are disorders in blood circulation and injuries affecting their ability to move.
- Movement is important to keep the spine healthy, improve circulation and reduce muscle fatigue.
- Low back pain is second only to upper respiratory infection as a cause for absence from work.
- The effects of poor ergonomic design is not typically limited to one organ or organ system. Many times a number of systems will be affected, with the failure of one system frequently initiating the failure of another.
- Over our life times, 8 out of 10 people will experience back pain.
